Let us use virtual box software for creating a virtual machine

Step1: Go to Browser and search for virtualbox

Step2: Click made VM Virtual box (https://www.virtualbox.org)

Step3: Download VirtualBox 7.0.10 platform package for windows host

Step4: After clicking on the windows host, you executable file will start to download

Step5: After downloading the executable file of Virtualbox go to downloads and click on the executable file.

Step6: A setup wizard dialog box will be opened click next.

Step7: Custom Setup and location where the virtual box need to installe. You can install on any drives

Step 8: After setting the location click next

Step 9: A warning for network interface will be shown if you are ok with it then click next

Step 10: Then on the next page click install

Step 11: After installation, just click finish on the new window with checkbox checked.

Step 12: After closing the virtual box setup virtual windows will be opened

Step 13: After, all these steps, your virtual box will be successfully installed

Steps to create virtual machine :-

Step 1: open virtual box

Step 2: click new.

Step 3: Enter the name of the virtual machine location and type of VM and version of the VM and click next

Step 4: Allocate the hardware size and no of processors and click next

Step 5: After finishing the above step a summary will be displayed and click finish.

Step 6: For shrinking or expand the size of harddisk go to tools -> virtual media player and click on the vm that you have created

Step 7: By clicking on it, the information will be displayed. But we can expand the disk size but can't shrink below the minimum size of the hard disk.

Step 8: At last, virtual machine will be created
